Intro To Java- North Campus

Final Project

GitHub- <https://github.com/eliotann99/final-project>

My project allows a cashier to take in an order from the customer and puts in the name of the item and the price. The program will do the math and add the taxes. It will display how much was the total price and will ask how the customer would want to pay. The program will take care from there depending on what method the customer chose to pay.

```
Output - finalProject (run)
run:
please enter the product.
a dell computer
now please enter the price
400
item scanned: a dell computer
its price: 400.0
your total is: 428.0

how do you want to pay?
1-credit card
2-gift card
3-cash
enter the number of the method of which you would like to choose
3
please insert how much cash you want to pay
5.00
your total is: 423.0

how do you want to pay?
1-credit card
2-gift card
3-cash
enter the number of the method of which you would like to choose
1
please insert your credit card balance
500
authorizing
the transaction was successful
BUILD SUCCESSFUL (total time: 58 seconds)
|
```

I would like to figure out a way on how to add more items to the program before going to the total price and the payment methods.
